

STC Modification Proposal Form

CM080: Transmission Impact Assessment process

Overview:

DNOs are obliged not to connect any new single embedded generation where it “may have an impact on the NETS” without undertaking a “Request for a Statement of Works” to NGESO. This process does not take into account the growing trend of smaller embedded generation connections.

A “Transmission Impact Assessment” process which facilitates an aggregated assessment process mitigates the need to apply to multiple individual connections saving time/admin and making it easier for NGESO to consider the *cumulative* impact of smaller individual connections.

Modification process & timetable

Status summary: The Proposer has raised a modification and is seeking a decision from the Panel on the governance route to be taken.

This modification is expected to have a: Medium impact on Transmission Owners.

Proposer's recommendation of governance route	Standard Governance modification without assessment by a Workgroup	
Who can I talk to about the change?	Proposer: Terry Baldwin Terry.Baldwin@nationalgrideso.com 07814 778 118	Code Administrator Contact: Sally Musaka Sally.musaka@nationalgrideso.com 07814 045 448

What is the issue?

The current Statement of Works (SoW) process can be inefficient and time-consuming where there are concurrent multiple smaller connection applications. In order to overcome these the Network Operators have trialled and refined a more efficient aggregated assessment (widely known as the “Appendix G” process) of Distributed Generators (DG) that have or may have an impact on the National Electricity Transmission System (NETS).

This proposal seeks to formalise the trial process into the STC (alongside CUSC modification CMP298 which introduces these arrangements in to the CUSC), which will work alongside the current Statement of Works process.

The reason an STC change is required is to:

1. Create the concept of an Evaluation of Transmission Impact (ETI) which has multiple routes to complete.
2. Create the concept and processes for the Transmission Impact Assessment (TIA) method to meet the ETI
3. Create the provision of ETI Trigger criteria per Grid Supply Point (GSP) so decisions can be made on the most appropriate ETI application route.

Why change?

Distribution Network Operators (DNOs) have an obligation to not connect DG where they determine the DG to be a Relevant Embedded Small or a Relevant Embedded Medium Power Station and may have an impact on the NETS.

The definition of Relevant Embedded Small (and Relevant Embedded Medium) Power Station currently refers to individual power stations which may have a significant system effect on the NETS with such significant impact being identified as an expenditure of more than £10,000.

This caters for single connections, viewed in isolation. However, aggregated assessment of DG (either via TIA or bulk SoW submissions) that have or may have an impact on NETS is needed given increasing amounts of embedded generation.

There is currently a code modification (CMP298) going through the CUSC change process to enable this transition, however for the modification to work the Transmission Owners will be required to submit additional information on available capacity at Grid Supply Points and also determine the ETI Trigger Criteria for each GSP, which will in-turn determine if a TIA or SoW is required.

What is the proposer's solution?

The proposed solution is that instead of a DNO applying for a statement of works for every single connection they can, where the ETI Trigger Criteria is met, request a TIA whereby they are assigned a block of available capacity to which they can connect multiple small and medium sized generation subject to a known amount reinforcing works needing to be carried out (if any).

To enable DNOs to correctly trigger an ETI, information is required from the TOs for each Grid Supply Point. The table below displays the required information and is suggested as a template to be entered into STCP 18-4.

ETI trigger Criteria table

- Any single or group of generators which falls below all the TIA trigger criteria can be connected without triggering an ETI.
- Any single or group of generators which is above any limit must be subject to a ETI, which can be completed by following either the SoW process or the TIA process.

GSP Name	DNO	ETI Trigger Criteria					ETI Method	TIA Data	
		Active Power (MW)	Apparent Power (MVA)	Reactive Power (Mvar)	Amperage (KA)	Voltage (kV)		Total MW	Materiality Trigger (MW)
Example	Western Networks	10	11	N/A	N/A	33			
Testing on	Easter Power	1	0.5	N/A	1	11	Transmission Impact Assessment (TIA)	150	26

TIA process

Once a DNO applies for a TIA the National Grid Electricity System Operator (NGESO) will validate the request and ask the relevant TO to calculate the Materiality Trigger available for the DNO's use. The Materiality Trigger available should be calculated as a function of the 'planning limit' however the calculation itself is left to individual TOs to decide.

Regular updates on the generation connected (in the form of 'Total MW') shall be provided to the TOs by the DNOs after validation by NGESO (minimum twice per year).

The Total MW shall not exceed the Planning Limit and this shall be reflected in the Materiality Trigger provided by the TO to NGESO. Once the Total MW is => the Materiality Trigger then the DNO (via NGESO) shall either request an increase in the Materiality Trigger (and any associated construction works) by extending the TIA or request that the Statement of works process shall be applied.

Draft legal text

The legal text will be drafted as part of the workgroup however the current proposed outline changes are as follows:

For the STC SECTION D: PLANNING CO-ORDINATION

- Rename section four from "Statement of works" to "Evaluation of transmission impact (ETI)" with Statement of works moving to a sub heading.
- At the end of section four add Transmission impact assessment process requirements.

For STCP 18-4

- Rename STCP 18-4 from “Request for a Statement of Works” to “Evaluation of transmission impact (ETI) assessment”
- Update introduction to describe the two routes available
- Change 3.2 to Statement of works process.
- Add a section 3.5 detailing the Transmission Impact Assessment (TIA) process

What is the impact of this change?

Proposer's assessment against STC Objectives	
Relevant Objective	Identified impact
(a) efficient discharge of the obligations imposed upon transmission licensees by transmission licences and the Act	Neutral
(b) development, maintenance and operation of an efficient, economical and coordinated system of electricity transmission	Positive This saves all parties time/admin and makes it easier for NGESO to consider cumulative impact of groupings of otherwise less-significant individual connections.
(c) facilitating effective competition in the generation and supply of electricity, and (so far as consistent therewith) facilitating such competition in the distribution of electricity	Neutral
(d) protection of the security and quality of supply and safe operation of the national electricity transmission system insofar as it relates to interactions between transmission licensees	Neutral
(e) promotion of good industry practice and efficiency in the implementation and administration of the arrangements described in the STC	Positive It mitigates the need for the “Statement of Works Request” process of having to apply to multiple individual connections.
(f) facilitation of access to the national electricity transmission system for generation not yet connected to the national electricity transmission system or distribution system;	Positive This will enable DNOs to provide faster and more accurate connection offers.
(g) compliance with the Electricity Regulation and any relevant legally binding decision of the European Commission and/or the Agency.	Neutral

Proposer's assessment of the impact of the modification on the stakeholder / consumer benefit categories

Stakeholder / consumer benefit categories	Identified impact
Improved safety and reliability of the system	Positive Enables NGESO to consider cumulative impact of groupings of otherwise less-significant individual connections
Lower bills than would otherwise be the case	Positive Enabling DNOs to offer more accurate connection costs should reduce the uncertainty risk reducing the connection cost.
Benefits for society as a whole	Positive Reduced connection costs should result in lower bills for consumers.
Reduced environmental damage	Neutral
Improved quality of service	Positive Reducing the admin requirements will ensure a smoother customer journey for new connections.

When will this change take place?

Implementation date

As soon as possible.

Date decision required by

A decision is required as soon as possible. This modification is required to enable CMP298 to proceed.

Implementation approach

A staged implementation plan will need to be created by the Workgroup for how the TOs will supply the required information at the GSPs.

Proposer's justification for governance route

Governance route: Standard Governance modification with assessment by a Workgroup

The legal text needs development by the working group as well as agreement on the details of how all TOs can follow the same process as there are some differences within the trial period.
